

Chapter 3

A function is a group of statements that exist within a program for the purpose of performing a specific task!

Hi homie..
I wanna tell you about simple functions :D
Ps.. I am a Python!

It is a very good idea to make a lot of small functions in your program - then it is easier to debug

global variables: are accessible to all the functions in a program file

local variables: are created within a function, and is only accessible to this function

```
def nice_function():
```

```
    you have a statement  
    a.k.a. a block  
    header=first line^  
    print('This is fun')
```

```
#Remember to execute  
nice_function()
```

OMG. Cool dude....
